Table 1

Note: This table reports the regression of income as a function of fentanyl and cocaine related deaths in the US. Column 1 shows the dependent variable as the traditional approach using survey data for

average rural household income. Columns 2-4 use satellite light intensity data, in particular column 2 establishes a classification of big villages. column 3 for medium-size villages and column 4 for small cities. All columns include state and monthly fixed effects and control by standard macroeconomic variables that affects the business cycle. Unit of observation is state x month.
